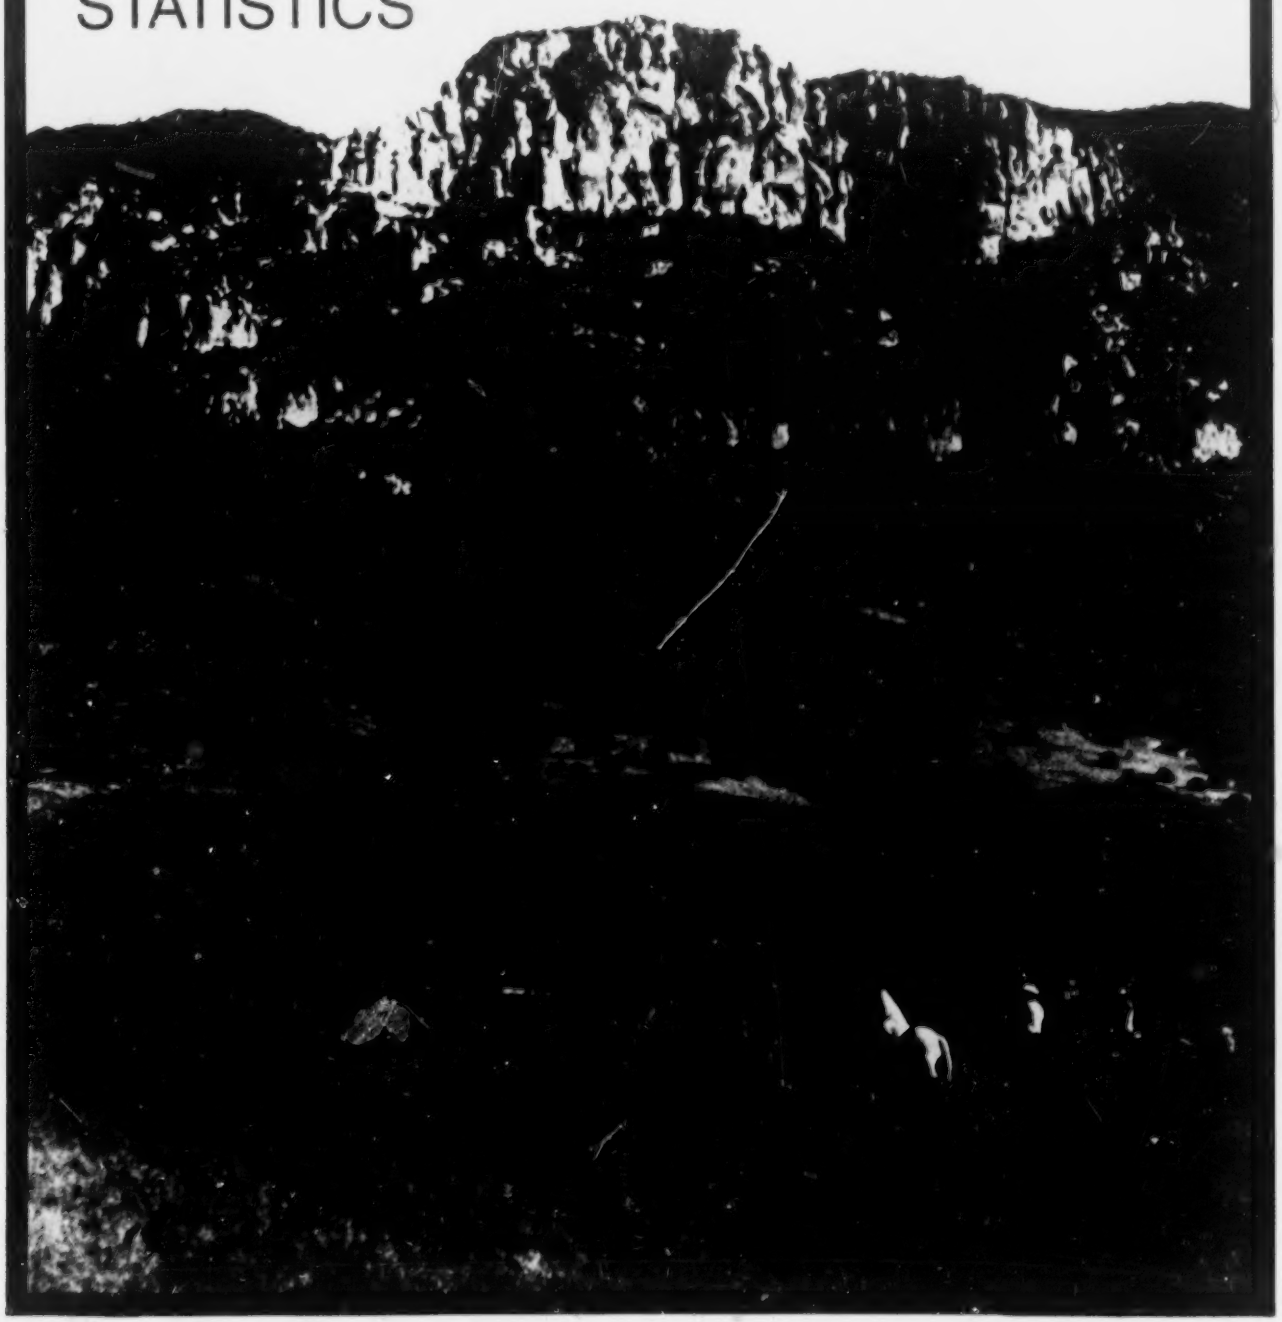
1986 ARIZONA AGRICULTURAL STATISTICS



ISSUED JULY 1987

We are pleased to present this twenty-second edition of Arizona Agricultural Statistics. This year's edition includes the following new features:

-- Corn and sorghum silage average price and value for 1986

-- Marketing year average prices for field crops 1979-1986

-- Small grain progress for the 1986 crop

-- Seeding rates for field crops

-- Citrus season average equivalent returns

-- Number of feedlots and marketings by size group

-- Range and pasture condition

-- Number of bee colonies and honey production

-- Ice milk production

-- Reformatted and more extensive economic data

I would like to extend a special thanks to the office staff, field and telephone enumerators of the Arizona Agricultural Statistics Service who collect, edit, summarize, type, verify, and publish the data that you find within the pages of this bulletin.

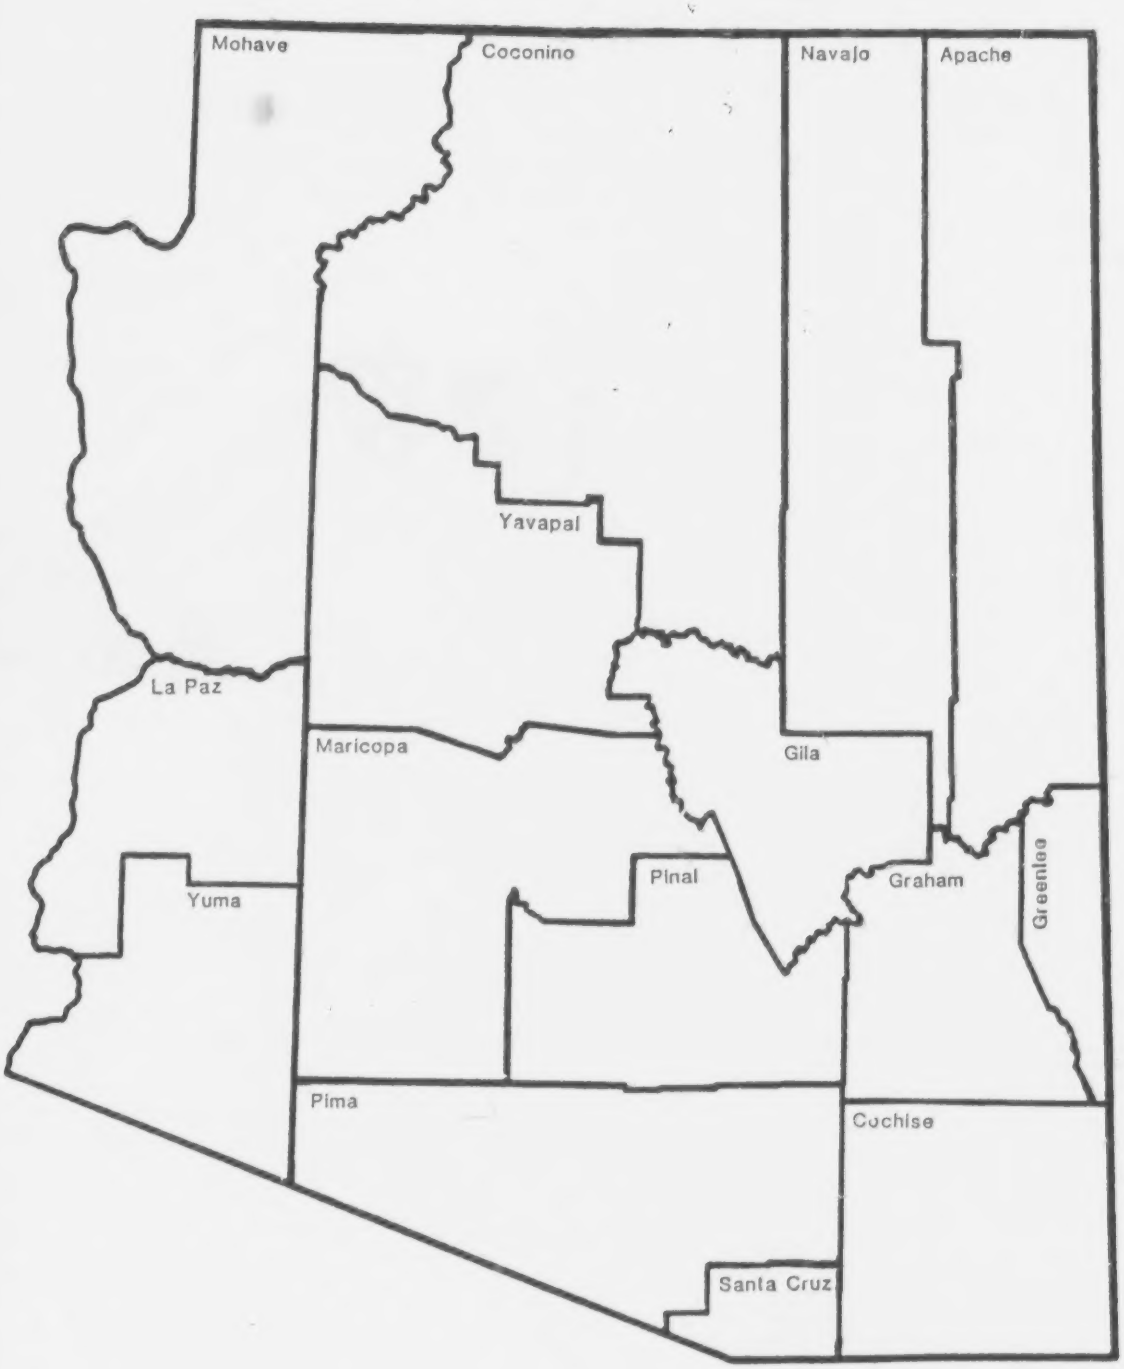
ARIZONA COUNTIES



INTRODUCTION

Arizona farm and ranch families have been very important in shaping the character and values of our state. We greatly appreciate those who have invested their effort and taken the risks to develop and maintain one of our state's largest industries.

This twenty-second edition of "Arizona Agricultural Statistics" officially documents the efforts of these families who produce the food and fiber for our state, nation, and the world. Included in this Bulletin are data for the most recent five years (1982-1986) which includes data at the county level for major crop and livestock items.

This publication is made possible through a joint effort of the College of Agriculture and the Arizona Agricultural Statistics Service of U.S.D.A. to supply current, detailed, and reliable information for decision-makers. We gratefully acknowledge the assistance and cooperation of the many farmers, ranchers, agri-business, other state and federal agencies, and other university departments who voluntarily furnish the basic information for this publication.

If you have any comments or suggestions regarding this publication, please feel free to contact me or the office of the Arizona Agricultural Statistics Service. We are here to serve you, the data user.

UNITED STATES	1,027,795	1,024,195	1,019,378	1,014,383	1,007,363	455

1/ Land in farms, along with "average size" of farm can be misleading, especially in the western states, since it excludes all state and federal public grazing lands which are leased on a per-head basis rather than a per-acre basis. Conversely, Indian lands that cannot be accounted for in the usual individual operator manner are reported as one farm or ranch by a central tribe source. In Arizona, Indian lands contribute over 20 million acres to the State's land in farms. The Navajo nation, as one farm, accounts for almost half of the Indian land. Arizona irrigated farms which are larger than 100 acres average about 650 acres in size.

FARM BALANCE SHEET: Arizona, December 31, 1981-85 1/

Item	1981	1982	1983	1984	1985
			Million dollars

Off-farm income 10/	214.8	218.3	223.4	240.7

1/ Includes operator households.
2/ Includes forest product sales, recreational income, and other farm business-related income. Estimates for 1982 and later include income from custom feeding services.
3/ Includes machine hire and customwork expenses; marketing, storage, and transportation expenses; and miscellaneous expenses. Definitions and data sources for 1978 and later are not directly compatible with those of earlier years.
4/ Includes contract labor expenses, hired labor wages, and Social Security payments.
5/ Uses different data sources for periods before 1979, 1979-83, and 1984 and later. Estimates are not directly compatible among periods.
6/ Excludes operator households.
7/ Cash income less cash expenses and capital consumption.
8/ Gross farm income less rental value of operators' dwellings.
9/ Gross receipts of farms less nonfactor payments, interest, wages to contract and hired labor, and net rent to nonoperator landlords.
10/ Includes off-farm income for members of farm operators' households only.

5/ December 1 inventory.
6/ Average number of hens and pullets of laying age, excluding commercial broilers.

FIELD CROPS

GENERAL: While Arizona is not home to the lion's share of crop acreages, it does, however, set the mark that other states strive to reach in terms of crop yield per acre. Arizona leads the nation in yield per acre for virtually every field crop that is produced in the State. For the 1986 crop year, the nation was led by Arizona in yield per acre for all cotton, including upland and pima; all wheat, including winter wheat; all hay, including alfalfa and other; barley; and corn silage. Arizona shared top honors with California in yield per acre for durum wheat. In yield per acre of sorghum silage, Arizona ranked second, and in yield of sorghum for grain, ranked third. Corn for grain yield ranked twenty-second in the nation. Following is a synopsis of field crop activities for the 1986 crop year.

COTTON: By the end of January 1986, seedbed preparation had begun in Yuma County in anticipation of the 1986 cotton crop. By mid-February, some fields in Yuma County were planted. By the first of April, planting activity had spread to southeast Arizona. Planting activity in both western and central Arizona was active by early April. Late April, however, brought fear to cotton producers in southeast Arizona in the form of nighttime temperatures that dipped into the high 20's, slowing plant emergence. Milder temperatures prevailed over the rest of the State, allowing the cotton to make good progress. Planting was virtually complete by early May, and weed and insect problems were minimal. By mid-May, some cotton was squaring in Yuma County and weed infestations remained light. Spraying was necessary in the central valley during June because of locally heavy boll weevil infestations, while cotton planting following grain harvest was reaching final stages in Pinal and Maricopa counties. By the end of June, bolls were setting in western and central Arizona. Favorable weather conditions prevailed through the summer months, and by early July, virtually all the acreage was squaring. In Yuma County, some bolls had opened by late July. Fruit load appeared heavier than normal and, by early September, cotton harvest was underway in Yuma County, with one percent of the acreage being "first picked". By late October, harvest was underway in all areas of the State. Rains hampered harvesting activities in Graham County, and hail knocked a few open bolls to the ground in Greenlee County. During November, cotton harvest proceeded at a rapid pace, and was winding down by early December. Pima cotton harvest progressed at a good pace, and was over half complete by early December. Late December marked the return of rains that delayed harvest for about two weeks. Harvest progressed as weather permitted for the remainder of December. Less than one percent of the crop remained for harvest by early January, and by the latter part of the month, fields were being shredded and plowed in preparation for the next year's crop. Problems that were encountered during the growing season were Texas black root rot that caused significant damage to a few fields in Pima County, pink bollworms, spider mites, boll weevils, weed infestation, and rust. Despite these obtacles, a new state record was set in 1986 for cotton yield.

WHEAT: Because of the uncertainty of the 1986 Farm Program, many wheat producers across the State elected to delay plantings of the 1986 wheat crop until more specific information was available. This uncertainty delayed some plantings until early January. For wheat producers who opted to plant on schedule, planting began in mid-November 1985 in the southeast portion of the State. By mid-December, very good progress was being made over most of the State, and the crop was thriving under good weather conditions. By the end of 1985, fifty-five percent of the State's acreage had been seeded. Germination was slowed in Yuma County because of seasonal cooler soil temperatures. Excellent weather conditions continued through the beginning of 1986, and a cold snap in early February did not adversely affect the condition of the crop. By mid-March, most of the State's acreage had been planted and some wheat was heading. Wheat that was seeded after the first of the year was reported to be in better condition than wheat seeded in the fall of 1985. During May, high winds caused considerable lodging in Yuma County and also caused some damage in La Paz County. At the end of the month, some producers had started to harvest, while others waited for the moisture content to reach an acceptable level. Wheat harvest was complete by early July in western and central Arizona and was completed in the southeastern portion of the State by the end of July.

SORGHUM AND CORN: Seedbed preparation for sorghum got underway during early March, with planting activities starting during early April. Planting progressed well under mild weather conditions through following months, and was 90 percent complete by early June. By the end of June, planting activity was winding down with no interruptions by inclement weather. During the last few weeks of July, harvest of sorghum for silage was underway with very good yields reported. By early August, sorghum remaining for grain was heading, and harvest got underway during early October in Cochise County. Other areas of the State reported sorghum at various stages of development. Rains and hail in Greenlee County during the latter part of the month caused limited damage. The crop continued to mature, but less rapidly because of ensuing cooler temperatures. By the end of November, however, harvest was virtually complete for the State. Corn planting was active in La Paz County during early February, while in other areas of the State, seedbed preparation was just getting underway. Corn planting was complete in all areas of the State by early April with the exception of southeast Arizona. Planting continued there until late June. By the end of July, corn harvest was underway in La Paz County. Harvest started in other parts of the State by September, and was virtually complete by the end of November. Second crop corn harvest in La Paz County began in late November, and was complete by the end of the year.

ALFALFA: Intermittent rains fell during October 1985, which occasionally ceased alfalfa planting activities. The rains proved to be very beneficial and good stands were reported. During December, there was some frost damage reported in Yuma County. The alfalfa crop was rated in fair to good condition during most of the growing season, with livestock grazing active until early April in some areas of the State. Weeds were reported more prevalent than normal in Yuma and Pima counties and some spraying occurred in La Paz County in an effort to control blue aphids. From April to September, cuttings were very active, and good yields were reported. There was good demand for high quality hay, but prices were less than ideal. Because of low prices, some producers stacked hay and waited for improved prices. In September, there were some higher prices, but supply was still great. By October, producers were preparing their fields for the next year's crop.

VEGETABLES, MELONS, & POTATOES

Area in production during 1986 for the eight principal vegetables and potatoes in Arizona totaled 75,900 acres, down 4 percent from 1985 but up 10 percent from 1984. This includes harvested acres in the 1985/86 season for lettuce, carrots, broccoli and cauliflower; other principal vegetables are for the calendar year. For those vegetables covered by the Agricultural Statistics Board, Arizona ranked third nationally in harvested area, total production, and total value of production.

Iceberg lettuce remained the most significant vegetable crop in the State, accounting for 49 percent of the total value of production for all vegetables. Nationally, Arizona ranked second in lettuce and cauliflower production, with honeydews ranking third and broccoli fourth.

The total value of vegetable production for Arizona showed a 17 percent increase over last year. A 44 percent increase in the season average price for cantaloups, as well as increased production for the other principal crops (except carrots and lettuce), contributed to this. Honeydews showed an increase in price and value of production but an 8 percent decrease in yield per harvested acre. Onions, broccoli and cauliflower all showed decreases in the value per unit. The drop in the cauliflower price was the greatest with a 15 percent decrease from last year and a 19 percent drop from 1984. An increase in onion yield, as well increased harvested acres for broccoli and cauliflower, contributed to the total value increase over last year for each of these crops. Watermelons showed an increase in yield, production and value over last year. Yield and production remained the same as last year for carrots but a 15 percent increase in price elevated the value of production 15 percent.

Value of miscellaneous vegetables increased over last year and made up 19 percent of the total value of vegetable production. The predominant crops were leaf and Romaine lettuce, greens, cabbage, green onions, squash, and rapini.

1/ Acreage and production figures from the Arizona Fruit and Vegetable Standardization Service reports.

2/ Value of production developed with the assistance of the Arizona Fruit and Vegetable Standardization Service, the Arizona Cooperative Extension Service, Market News Service, and local growers.

3/ Not available.

4/ Includes asparagus, bell peppers, celantro, celery, chili peppers, cucumbers, Maza corn, Mexican corn, miscellaneous melons, napa, okra, rutabagas, sweet corn, and tomatoes prior to 1985; anise, arrugula, artichokes, bell peppers, celentro, celery, chili peppers, green beans, Maza corn, Mexican corn, miscellaneous melons, okra and rutabagas for 1985 and 1986.

5/ Not available due to the different units of production for these vegetables.

FRUITS & NUTS

Although Arizona citrus growers produced less during the 1985-86 season than the previous season, value of sales increased 11 percent to $84.5 million. Production of all oranges decreased 6 percent to 4.6 million cartons, with value of sales decreasing 31 percent to $15.9 million. Navel, sweet, and miscellaneous orange production totaled 1.2 million cartons, valued at $5.6 million. Valencia production totaled 3.4 million cartons with a value of $10.3 million. Grapefruit production dropped 20 percent to 2.4 million boxes. The grapefruit crop was valued at $11.7 million. Although lemon production dropped significantly, last year's crop was valued at $48.5 million, up 76 percent from the previous season. Production of tangerines, estimated at 1.4 million cartons, was unchanged from the previous season and was valued at $8.3 million, down 4 percent from 1984-85.

The usual marketing season for all oranges is November 1 through June 30. Navels and sweets are harvested first, followed by Valencias in late February. Orange prices at the beginning of the marketing season were strong, but by the end of the season had dropped dramatically. The grapefruit marketing season usually extends from November to July, and prices for the 1985-86 marketing season were virtually unchanged from the previous season. Lemon prices showed a strong increase during the first months of the marketing season, and only started to decline during the last portion of the season. The usual marketing season for lemons in Arizona is mid-August through the first of March. Tangerines, usually marketed in the short time frame from November to February, showed neither a strong increase or decrease in price, and value of sales was virtually the same as the value for the previous season.

Bearing acreage of grapes in 1986 totaled 6,328 acres in Arizona. Production for 1986 totaled 23,000 tons, the highest on record in the State. Yield was estimated at 3.63 tons per acre. Most of the production in the State is for fresh use, with a very small quantity processed into wine. The usual marketing season for table grapes in Arizona is June and July.

Apples continue to be the more significant of the deciduous tree fruits grown in the State. During 1986, there were 2,969 producing acres, and production was estimated at 400,000 cartons, almost four times the 1985 production. Value of production totaled $4.4 million, nearly six times the value of the 1985 crop. Other deciduous tree fruits grown in the State include apricots, nectarines, peaches, plums, and figs. The combined producing acreage of deciduous fruits in the State totals over 4,000 acres.

Producing acreage of tree nuts in the State totals over 18,000 acres. Pecan trees continue to make up the bulk of the acreage, with over 14,000 acres in production during 1986. Other tree nuts grown in the State include pistachios, with 1,306 acres in production, and almonds, with 2,800 acres in production in 1986.

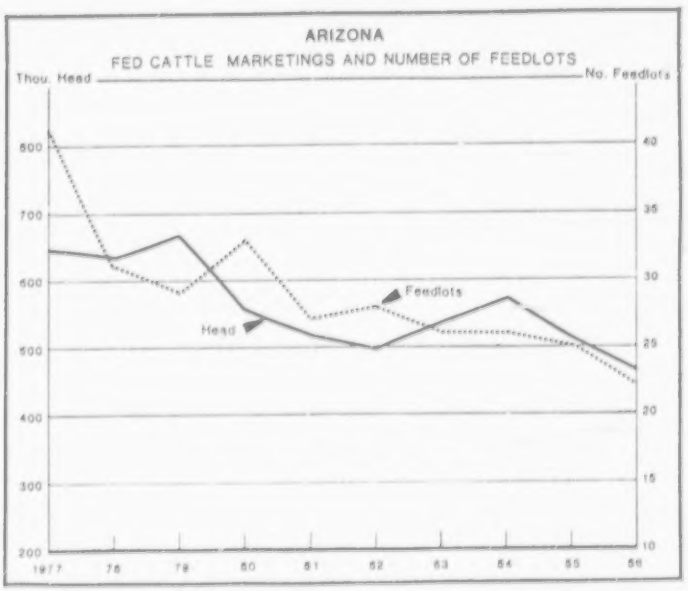
CATTLE AND CALVES

Arizona's cattle and calf inventory totaled 1.0 million head as of January 1, 1987, 5 percent below levels reached during 1985 and 1986. Cattle and calves in Arizona numbered 200,000 head when statistics were first kept in 1867, and did not exceed 1.0 million head until 1907, when cattle inventories reached 1.05 million. The year Arizona gained statehood (1912), cattle numbers totaled 915,000 head, and with the end of Word War I (1918), the cattle industry had peaked at 1.75 million, the largest inventory since records were kept. Inventories exceeded 1.0 million head for the next 8 years; however, they did not reach 1.0 million head again until 1956 (30 years later). In recent times a peak occurred in 1973 with cattle and calves at 1.4 million.

The cattle industry generated gross income of $425.9 million during 1986, down 3 percent from 1985's gross receipts of $437.3 million. This drop in gross income is partially attributed to a softening in prices received for cattle, down $2.80 to $51.90 per hundredweight during 1986. Prices received for calves dropped $4.60 to $58.60 during 1986. A breakdown by class reveals the following year to year comparisons: Cattle on feed as of January 1, 1987 totaled 343,000, down 1,000 head from 1986. Of these, steers (500+ lbs.) totaled 252,000, down 29,000; heifers (500+ lbs.) numbered 5,000, down 1,000; with the balance being 86,000 steer and heifer calves (under 500 lbs.), up 29,000 head. The cattle feeding industry started 1986 with 25 commercial feedlots, and currently 17 feedlots remain, operating at 69 percent of capacity, up 17 percentage points from a year earlier. One hundred two feedlots were in operation in 1965, representing a cattle on feed inventory of 348,000 head. Statistics were first kept for cattle on feed in 1930, when 23,000 head were in Arizona feedlots (the lowest level on record). It was not until 1953 that inventories exceeded 100,000 head. Cattle on feed inventories peaked during 1973 at 658,000 head. Although fed cattle numbers were slightly below 1986, and 18 percent below 1985, the cattle feeding industry still ranks among Arizona's largest ag-related industries, in terms of gross sales in the State. According to SUCCESSFUL FARMING magazine January 1987, 4 of the largest farms in the State are feedlots, with 10 feedlots listed in the top 20.

Inshipments numbered 530,000 during 1986, down 3 percent from 1985. This drop is primarily attributed to a 4-5 percent smaller available supply of feeders and calves. Cattle inshipments into Arizona are primarily for feedlot placement, with 97 percent being steers. These cattle are shipped from such places as Texas, Mexico, Utah, New Mexico, Mississippi and Oregon. Forty-five percent are from Texas, whereas 31 percent came from south of the border.

The largest component of Arizona's cattle industry is range and other cattle and calves, which numbered 550,000 head (down 47,000), as of January 1, 1987. Range cattle and calves include beef cows of 268,000 (down 25,000); bulls, 30,000 (down 1,000); beef replacement heifers, 54,000 (up 7,000); range steers, 33,000 (up 8,000); calves (excluding feedlot), 152,000 (down 45,000); and other heifers (excluding feedlot), 13,000 (up 9,000).



ALL CATTLE AND MILK COWS: Number of operations and inventory, Arizona and United States, January 1, 1983-87 1/

DAIRY

A Dairy Buyout Program was implemented by the Federal Government in 1986 to reduce dairy resources. Under this program, dairy farmers across the nation would be paid by the Federal Government to slaughter their herds and then remain out of milk production for the following five years. Remaining dairy farmers could potentially increase production to be used in additional production of fluid and manufactured dairy products. Some effects of the Dairy Buyout Program are: fewer but larger herds, reduced production capacity, and less incentive to the farmer to produce milk because of lower prices. The target of the program was to reduce national productive capacity by twelve billion pounds. After the program was announced, bids from fifteen of the dairies in the State were accepted, slating approximately ten thousand cows, heifers, and calves for slaughter or export during the period April 1986-August 1987.

During 1986, several television and radio commercials promoting milk and milk products were seen and heard by numerous consumers. There were and still are commercials being shown which encourage consumers to eat their cereal with milk, eat cheese, and one commercial proclaims milk as "America's favorite health kick." Several commercials are sponsored by United Dairymen in an effort to increase public awareness about milk.

The average number of milk cows in the State of Arizona averaged 86,000 head, unchanged from the 1985 average. For the last two years, the number of milk cows has been a record for the State. Milk per cow is estimated at 15,907 pounds, compared with 15,674 pounds last year. The 1986 estimate of milk per cow is also a state record and ranks fourth nationally. Total milk production totaled 1.368 billion pounds, also a state record.

1/ Plants manufacturing one or more dairy products.

SHEEP AND LAMBS

Total inventory numbers for Arizona sheep and lambs increased 2 percent during 1986 to 283,000 head on hand January 1, 1987. The 1986 lamb crop of 112,000 was the same as 1985. This was the second consecutive year of increase in the sheep inventory. This increase can mostly be attributed to the increase in sheep on feed January 1, to double the previous year. Stock sheep accounted for 77 percent of the State's inventory; the remainder were fed sheep and lambs.

The sheep industry was concerned with predators and the possible release of the Gray Wolf in western states. Prices, imports and fluctuating demand for American grown wool were also major concerns. Producers were finding grazing pastures and alfalfa fields mostly in Yuma County where sheep and lambs on feed doubled the year-earlier level.

Total sheep and lamb marketings during 1986 totaled 209,000 head, an increase of 8 percent from 1985. There were 21.2 million pounds marketed, up 13 percent from a year earlier. This calculates to an average liveweight of 101 pounds compared with 97 pounds in 1985. Cash receipts decreased for the second consecutive year, down 19 percent to $5.6 million in 1986. Prices were lower in 1986; sheep fell from $19.70 in 1985 to $15.30 in 1986 while lamb prices dropped from $69.50 to $64.60 per hundredweight.

Wool production for 1986 increased 3 percent to 2.0 million pounds. This increase is due to the higher number of head shorn, up 2 percent to 281,000 head in 1986. The average fleece weight remained the same as the previous year at 7.0 pounds. The total value of wool produced totaled $1.0 million in 1986, up 7 percent from 1985. The price per pound increased 2 cents to 53 cents per pound.

SHEEP: Number of operations and inventory January 1, Arizona and United States, 1983-87 1/

Year	Arizona		United States	
	Operations	Head	Operations	Head

HOGS AND PIGS

Total inventory of all hogs and pigs in Arizona on December 1, 1986 totaled 155,000 head, 11 percent below 1985, but only 1 percent below a 10-year average. Swine inventories were first kept in 1870, with all hogs and pigs numbering 1,000. It was not until 1977 that inventories exceeded 100,000 head, and they have not fallen below this level in the past 10 years. The decline of 20,000 head from December 1985's inventory of 175,000 (the second largest inventory in 117 years of data), to December 1986's inventory of 155,000, is primarily attributed to several large operations going out of business. Commercial hog slaughter in Arizona declined by 74 percent from 1985, as the result of the breakup of the Arizona Pork Producers Association (APPA). APPA in the past has performed 90 percent of Arizona's commercial slaughter, and with the removal of this Association's plant, most Arizona hogs are shipped to California for slaughter. Commercial hog slaughter in Arizona totaled 69,300 head in 1986, off 201,200 head from 1985, representing the lowest number of hogs slaughtered since 1947, when 62,900 head were processed. Hog liveweights advanced one pound per head to 222 pounds during the year.

A breakdown by class reveals the following: Breeding hogs totaled 18,000 (12 percent of all hogs and pigs), while the majority (88 percent, 137,000 head) were market hogs and pigs. Average prices received for hogs and pigs increased 19 percent during 1986, from $46.00 per hundredweight in 1985 to $54.70 per hundredweight in 1986, returning some profitability back to this industry. Gross income generated by Arizona's pork industry likewise increased $5.7 million from $27.8 million in 1985 to $33.4 million in 1986.

The Arizona pig crop for 1986 totaled 263,000 pigs from 33,000 sows farrowing during the spring and fall. This compares with a pig crop of 287,000 during 1985 from 38,000 sows. During 1986, 16,000 sows farrowed during the spring (December 1985 - May 1986), for an average litter rate of 7.8 pigs, up from 7.4 during 1985. Seventeen thousand sows farrowed during the fall (June 1986 - November 1986), producing 138,000 pigs, an average of 8.1 pigs per litter, up from 7.7 pigs per litter during fall 1985, and the largest fall pig per litter rate in over 56 years of data.

HOGS: Number of operations and inventory December 1, Arizona and United States, 1982-86 1/

Year	Arizona		United States	
	Operations	Head	Operations	Head

1/ For producers with five or more hives.

FARM LABOR

The farm employment and wage rate estimates are for the week that includes the 12th of the month. This corresponds to the week specified in general employment and wage series of other Government agencies.

Self-employed workers are defined as the operator and others who work on the farm without pay, but share in the returns from the farm. This concept was adopted in 1982 to provide data users with an agricultural series analogous with other industrial series. With the adoption of the self-employed category, all active partners working on the farm are counted as self-employed, whereas prior to 1982 only one was counted as the operator and the others were listed in the unpaid family category. Self-employed workers are counted if they work at least 1 hour during the survey week. Unpaid workers must work at least 15 hours or more to be counted.

Hired workers include both family members and other workers who are paid by the farm or ranch operator for working on agricultural jobs for 1 hour or more during the survey week. Workers paid by a crew leader or agricultural service firm hired by the farm or ranch operator to perform specific tasks are not included in the number of hired workers or wage rate statistics. A separate tabulation of these agricultural service workers is maintained only for the Nation, California, and Florida.

INTERNATIONAL TRADE

It is not possible under present methods of statistical measurement to determine what amount of Arizona's production is actually sold abroad. No reliable system of reporting this information has yet been designed, and no official series exists. If such figures were available they would be of little use to farm analysts and producers unless they bore some regular relationship to the state's annual agricultural production.

The alternative that is usually taken is to impute to each state a share of U.S. exports proportional to its share of total U.S. production. The export values appearing in the following table were calculated in this manner for the years 1981-82 through 1985-86. The ratio of Arizona production to U.S. production for each commodity listed was multiplied by the value of U.S. exports of that commodity. The same procedure can also yield an export value share for the southwest states taken together. While in certain cases the actual export value can be found to differ from the imputed export share, the defense of the calculation rests on the principle that supplies of a given commodity from one state or another are essentially interchangeable in domestic and foreign markets.

To make the apportionment of exports to states more realistic, data for certain groups such as feed grains were limited to states that account for 90 percent of the output. It was also assumed that a state would share in exports only if it had an apparent surplus. The latter involves computing grain-consuming animal units and the amount of grain needed to sustain those number.

For a detailed analysis see, Arizona and the U.S. Foreign Trade in Agricultural Commodities, by Robert Rothenberg and Jimmye S. Hillman, University of Arizona, College of Agriculture, July 1981.

AGRICULTURAL EXPORTS: Arizona's equivalent share of value, by commodity group, fiscal years 1981/82-1985/86 1/

WEATHER

Annual rainfall amounts were above normal during 1986 for the fifth consecutive year. Weather stations at Yuma and Kingman were the only locations where the rainfall totals were below 1985. Flagstaff received 32.39 inches of precipitation, 11.5 inches above normal. Douglas, McNary, Parker, Prescott, Willcox, and Window Rock ranged from 2.4 to 6.3 inches above normal. Rainfall statistics vary considerably within Arizona because of the diverse geographic regions and elevations. Yuma can expect the lowest annual rainfall, only 2.65 inches, while McNary can plan on the highest average among major reporting stations in Arizona at 27.24 inches.

Weather patterns over Arizona normally originate from the Pacific and Arctic regions. This weather comes in from the west with occasional cold bursts directly from the north. This pattern persists until the summer, when the monsoons begin. Weather patterns approach from the south during the monsoons,which usually last through September. October is a transitional month with the weather changing from a southerly flow to a westerly direction again.

A "monsoon day" is defined as a day with an average dew point of 55 degrees or higher. The word "monsoon" comes from an Arabic word for season. The term was originally applied to windstorms from over the Arabian Sea. However, the term has come to mean almost any large-scale, wet wind that blows regularly during a definite season. Monsoon is a very moist wind that blows from tropical and sub-tropical waters to the hot land areas in summer and from the cold land areas to warm waters in winter. The monsoon onset is often dramatic and occurs when the very hot, dry air is replaced by a surge of moist, tropical air. The results are uncomfortable heat and humidity with an abundance of thunderstorms. The monsoon feature is more pronounced over the southern and central sections of the State and becomes more marginal over northern areas.

During January through March, 1986, temperatures were generally above normal. Precipitation was below normal during much of January, but sufficient rainfall occurred during the next two months to end the quarter at a near normal level. Record highs were set at Phoenix and Tucson in January and February. Yuma recorded a high of 97 degrees in February, probably the highest temperature ever in Arizona during February. By the end of March, soil moisture and stock water were adequate throughout the State, except in Santa Cruz and Cochise counties, where a surplus was reported. Crops were progressing ahead of normal due to above average temperatures.

Weather during the months of April, May, and June saw below normal rainfall with temperatures above normal. Around May 1, pasture and range conditions were generally above normal; however, by June 1 conditions had deteriorated to below normal across the State with a number of small range fires reported on the Hopi Reservation towards the end of May. By July 1, drought conditions were reported in the lower elevations as tank water and soil moisture became very low. Crops, however, during this period made normal progress with routine irrigations and insect controls taking place in all producing areas.

The July-September quarter began with the monsoon commencing full force, bringing much needed moisture to the eastern two-thirds of the State. At Phoenix, it was the first time on record that measurable rain was recorded on each of the first four days of July. Monsoon conditions continued for most of July and August with nearly all weather stations now reporting above average rainfall. Flagstaff received 2.68 inches of rain in 1 hour and 15 minutes during a downpour in August. The extreme western part of the State received very little or no precipitation during this quarter which is normal for this area. By mid-September, cooler, very dry air covered the State with minimum temperatures the lowest since spring.

October proved to be a stormy month. One storm, during the second week of October, moved through the State with winds, estimated to 100 miles per hour, causing severe dust storms between Buckeye and the California border. Hail .25 to .50 inch in diameter was reported at a number of locations in the Salt River Valley. The storm delayed cotton harvest and some respraying for defoliation was necessary. Temperatures during November and December averaged above normal. Frequent rain storms during December slowed fieldwork and delayed the wrap-up of cotton harvest. The wettest areas were in southeast Arizona in the Willcox area. Ranges and pastures benefited from timely rainfall making prospects for spring feed excellent throughout much of the State.

Show Low Creek	Show Low Lake	5.1	5.1	3.6	5.1	3.1	5.1

WATER SUPPLY: Arizona continues to enjoy the prospect of above average surface water supplies. Greater than normal streamflow was forecast for the April-May period. The April 1 snowpack was above average on major basins even though precipitation for the month of March was below normal. Reservoir storage is considered very good.

SNOWPACK: The April 1 snowpack was well above average on major basins. Snow water equivalent ranged from 127% of average on the Verde River basin to 141% on the San Francisco/Gila basin. The San Francisco Peaks measured 112%. Some areas were somewhat below average such as the Grand Canyon at 66%, the Chuska Mountains at 86%, and the Mimbres River, 78%. One reason that snowpack percentages tended to remain high was that the last half of March turned cooler than usual and snowmelt which usually occurs in late March was delayed.

PRECIPITATION: March was a fairly stormy month but in general the amounts were small and moisture was below average over the state. The monthly precipitation ran 64% of average on the Verde River, 65% on the Salt River, 73% on the Little Colorado, and 85% on the Gila basin. Northwestern Arizona received 72% of normal moisture and the Mimbres watershed, 87%. The water year precipitation since October 1 is still near to above average.

RESERVOIRS: Most reservoirs serving the water needs of Arizona continue to report excellent volumes in storage as of April 1. The Salt River Project dams held 1,915,000 acre feet which accounted for 95% of the system's storage potential. San Carlos reservoir was 84% full with 782,000 acre feet in storage. Lake Pleasant was still somewhat low with 65,000 acre feet at41% of capacity. Lakes Powell, Mead, Mohave, and Havasu held a combined storage of 48,330,000 acre feet which is 90% of capacity. Show Low Lake was full with 5,100 acre feet and was spilling. LymanLakewas holding 30,600 acre feet and was very close to spilling. Watson Lake held 4,400 acre feet and Willow Lake, 5,300 acre feet.

STREAMFLOW: April-May forecasts called for near to above average streamflow. The Verde River should run 103% of average and the Salt River, 138%. The San Francisco at Clifton is forecast at 167%. The upper Gila River is forecast at 117% at Virden but should run 145% at the head of Safford Valley due to the contribution of the San Francisco. The Little Colorado River is expected to produce 189% of average inflow to Lyman Reservoir. The Mimbres River forecast is for 119% of average flow. Spring runoff on the Colorado River is forecast at 93% into Lake Powell. March streamflow was above average on most streams due to carryover runoff from the late February storm. Only the upper Gila ran below average at 69%. Runoff ranged from 114% on the Salt to 159% on the San Francisco.

1/ Lake level above spillway elevation.
2/ Not available.

OTHER STATISTICS

UPLAND COTTON OBJECTIVE YIELD FORECASTING PROGRAM

The upland cotton yield forecasting program of the Arizona Agricultural Statistics Service includes both regular interviews with farmers, and objective measurements from samples in randomly selected fields.

During the yield forecasting season (August 1 to harvest), trained enumerators make monthly visits to randomly selected fields across the State. Row spacing measurements, plant counts, fruit counts, and other pertinent information affecting crop yields are recorded. The grower is interviewed to obtain information about acreage, seeding rates, fertilizer applied, and other information about the fields where objective counts are to be conducted. A State yield is generated from the different models used to forecast total bolls expected, average boll weight, and harvesting loss.

The number of samples varies from year to year as a result of changes in program size, grower refusals, or sometimes losses because of abandonment. Samples are also visited after the crop is harvested to obtain measurement of harvesting loss and other information affecting production.

The sample data published below were edited to eliminate nonrepresentative reports but still contain some sampling fluctuation. They are not official Agricultural Statistics Board estimates, but provide indications and trends in cropping practices.

FERTILIZER USED ON UPLAND COTTON ACREAGE HARVESTED: Arizona, 1982-86

Year	Fields in survey	Acres receiving				Rate per acre receiving 1/			Acres fertilized 2/		
		Any fertilizer	N	P_2O_5	K_2O	N	P_2O_5	K_2O	At or before seeding only	After seeding only	At or before & after seeding
	Number	Percent				Pounds			Percent		
1982	99	95	94	35	3	126	59	34	3	60	37
1983	82	90	90	45	11	113	43	14	4	50	46
1984	91	99	98	48	4	150	59	29	12	55	33
1985	96	95	95	51	9	157	55	6	11	57	32
1986	97	93	93	39	7	122	47	12	16	56	28

1/ To convert phosphoric oxide (P_2O_5) to elemental phosphorus (P), the quantity of P_2O_5 should be multiplied by 0.43642. To convert potassium oxide (K_2O) to elemental potassium (K) multiply by 0.83016.
2/ Percentages apply to acres receiving fertilizer, not to total acres harvested.

UPLAND COTTON SAMPLES: Percentage distribution by row spacing, average row width, seeding rate, and plant population, Arizona, 1982-86

Year	Cotton samples	Row spacing (inches) 1/				Average row width	Seeding rate per acre 2/	Plants per acre
		36.5 & less	36.6 - 38.5	38.6 - 40.5	40.6 & greater			
	Number	Percent				Inches	Pounds	Number
1982	98	5	33	46	16	39.1	19.2	35,836
1983	94	-	45	43	12	39.2	18.9	33,877
1984	105	5	42	47	6	38.2	19.9	35,232
1985	104	4	53	41	6	38.7	20.1	37,581
1986	99	6	48	42	4	38.5	19.2	44,074

1/ Measurement across 8 row spaces in each sample field.
2/ Acid delinted basis.

UPLAND COTTON SAMPLE COUNTS: Bolls produced, weight, lint loss, and yield per acre, Arizona, 1982-86

Year	Final count of large bolls produced per ten feet of row 1/	Adjusted average weight per boll		Unopened bolls not harvested per ten feet of row 1/		Lint loss per acre after all harvest complete	Final adopted yield per acre
		Seed cotton 2/	Lint	Bolls	Lint equivalent per acre		
	Number	Grams	Grams	Number	Pounds	Pounds	Pounds
1982	272	4.18	1.59	4	4.7	128	1,130
1983	285	4.04	1.50	5	5.8	92	1,225
1984	296	4.03	1.50	3	3.1	69	1,227
1985	312	3.91	1.46	4	3.9	99	1,241
1986	312	4.09	1.57	7	7.9	88	1,301

1/ A "large" boll is one inch or greater in diameter, opened or unopened. Counts are actually made on 46 feet of row in each sample field.
2/ Seed cotton adjusted to 5 percent moisture; 453.6 grams equal one pound.

4/ U.S. Department of Commerce, Bureau of Census, 1980.

5/ The term "water" includes permanent inland water surface such as lakes, ponds and reservoirs having 40 acres or more of area and streams and canals one-eighth mile or more in width.

6/ Less than 0.5 percent.

GRAZING FEES: 1983-87

Approximately 44 percent of Arizona's total area of 72,960,000 acres is federal and state public trust lands administered by the U.S. Department of Interior's Bureau of Land Management, the U.S. Department of Agriculture's Forest Service, and Arizona's State Land Department. A majority of these public lands are leased for livestock grazing. Permittees and lessees are charged for the grazing use according to the number of animal unit months (AUM's) of forage they are authorized to use. An animal unit is considered to be one mature cow or equivalent.

Fees for grazing on federal public lands have been determined by a formula established in the Public Rangelands Improvement Act of 1978 (PRIA) for the years 1979-1985. Executive Order 12548 of February 14, 1986 directed a continuation of the PRIA formula until Congress enacts new legislation regarding fee schedules. Additionally, the Executive Order stipulated that the fee shall be not less than $1.35 per AUM.

Arizona adopted the federal fee formula for state trust lands beginning in 1982, except that a base year fee of $.95 is used instead of the federal base fee of $1.23, the difference being a credit for range improvements made on state lands and for taxes paid on those lands by the lessees. That formula continued in effect for 1987.

Grazing fee formula components are compiled by the USDA's Agricultural Statistics Board and furnished to USDI Bureau of Land Management, USDA's Forest Service, and the Arizona State Land Department for calculating the grazing fee each year. The components are made public at the same time, during the last week of December.

Individual agencies should be contacted regarding the administration of public lands.

PUBLIC LAND GRAZING FEE FORMULATION

Grazing fee components	Unit	Base year 1964-68	Grazing fee year				
			1983	1984	1985	1986	1987
Grazing Rates on Private Land Per AUM 1/	Dollars	3.65	8.36	8.85	8.86	8.40	8.10

Prices Paid Index (PPI) 5/		100	378	387	395	397	388
Federal Grazing Fee 6/	Dollars	(1.23)	1.40	1.37	1.35	7/ 1.35	7/ 1.35
State Grazing Fee 6/	Dollars	(.95)	1.07	1.05	1.05	.73	.66

1/ Privately-owned, non-irrigated land in eleven western states: Arizona, California, Colorado, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, Wyoming. An animal unit month (AUM) is the grazing of one cow, one horse or five sheep for one month.

2/ Private grazing rates current year divided by base year times 100.

3/ Average for twelve months November-October prior to the fee year for eleven western states; see footnote 1.

4/ Beef cattle price current year divided by base year times 100.

5/ Index of prices paid for beef cattle production inputs as percent of base year.

6/ The grazing fee = base year fee (FVI + BCPI - PPI) ÷ 100. 1985, for example = $1.23 (243 + 262 - 395) ÷ 100 = $1.35 (federal); $.95 (243 + 262 - 395) ÷ 100 = $1.05 (state).

7/ Minimum fee established by Executive Order.

FEED: Prices paid by farmers, Arizona, 1982-86

HOW TO ORDER

- **Check appropriate box.**
- **Calculate the total charges for subscription and enter below.**
- **If your address is outside the United States, use "foreign" price.**
- **Make check or money order payable to USDA/NASS.**
- **Do not send cash.**
- **Allow 2 weeks for processing.**
- **For additional information about reports and ordering, call (202) 447-4021.**
- **Mail this entire order form: AGRICULTURAL STATISTICS BOARD PUBLICATIONS**
  ROOM 5829, SOUTH BUILDING
  U.S. DEPARTMENT OF AGRICULTURE
  WASHINGTON, D.C. 20250

Please send me the item(s) I have indicated above.
